$^{87}\text{Rb}$  :  $\text{RbNO}_3$

Massiot, Ecole RMN des Houches, 1997.

# <sup>1</sup>H solid state NMR: another challenge

<sup>1</sup>H: strongly coupled by the homonuclear dipolar interaction !

remember:

$$D_{\text{H}} \sim \gamma^2 / r_{\text{H}}^3 \text{ up to 30 kHz...}$$

high for <sup>1</sup>H

rather small

question: is the MAS reorientation efficient ?

# Two different approaches

first idea: highest  $B_0$  and highest  $\nu_{rot}$  !

second idea: rotations in spin space !

multiple pulses (MP)

# Comparison of techniques

... what is the limit of resolution in <sup>1</sup>H solid state NMR !?

don't forget the role of molecular motion !...

**CRAMPS: Combined Rotation And Multiple Pulses Spectroscopy**

Azaïs, PhD thesis.

# Cross Polarization (CP): a simplified description

question: is it possible to transfer magnetization from  $^1\text{H}$  to  $^{13}\text{C}$  ?

Engelke, Encyclopedia of NMR, 1996, 1530.

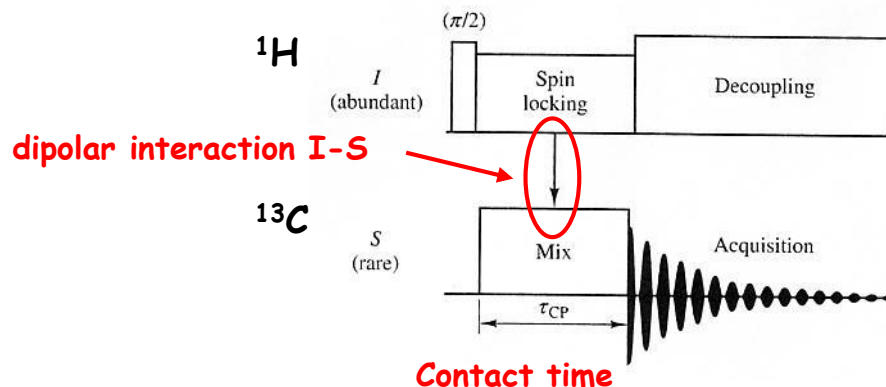

Hartmann and Hahn (1962):

**NO** in the LAB frame mais **YES** in the rotating frame

$$\Omega_{1I} = \gamma_I B_{1I} = \Omega_{1S} = \gamma_S B_{1S}$$

Hartmann-Hahn condition on  $B_1(\text{RF})$  fields

the most popular sequence

advantages:

- ◆ gain:  $M_S (\gamma_{1\text{H}}/\gamma_S)$  → 4 for  $^{13}\text{C}$   
10 for  $^{15}\text{N}$  !
- ◆  $\tau_{\text{CP}} \sim \text{ms}$  !
- ◆  $T_1(^1\text{H}) \ll T_1(^{13}\text{C})$
- ◆  $^{13}\text{C}$  FID with  $^1\text{H}$  decoupling

How to manage the  $^{13}\text{C}$  CSA interaction ?

# The CP MAS experiment

$^{13}\text{C}$  in

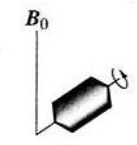

(a) solid (solution state conditions)

(b) CP (low power decoupling)

(c) CP (high power decoupling)

(d) CP MAS (high power decoupling)

(e) solution (low power decoupling)

RF MAS

$$\Omega_{1I} = \Omega_{1S} \pm n \Omega_{rot}$$

with  $n = 1, 2$

modified Hartmann-Hahn conditions

# CP dynamics: quantitative approach

exponential build-up of the magnetization

$$M_S^{CP}(t_c) = \frac{\gamma_I}{\gamma_S} M_S \frac{1}{1-\lambda} \left[ \exp\left(-\frac{t_c}{T_{1\rho}^I}\right) - \exp\left(-\frac{t_c}{T_{1S}^I}\right) \right]$$

**gain !**
**loss !**
**gain !**

$T_{CH}({}^{13}\text{CH}_2) < T_{CH}({}^{13}\text{CH}) \ll T_{CH}({}^{13}\text{C}_{\text{quat}})$

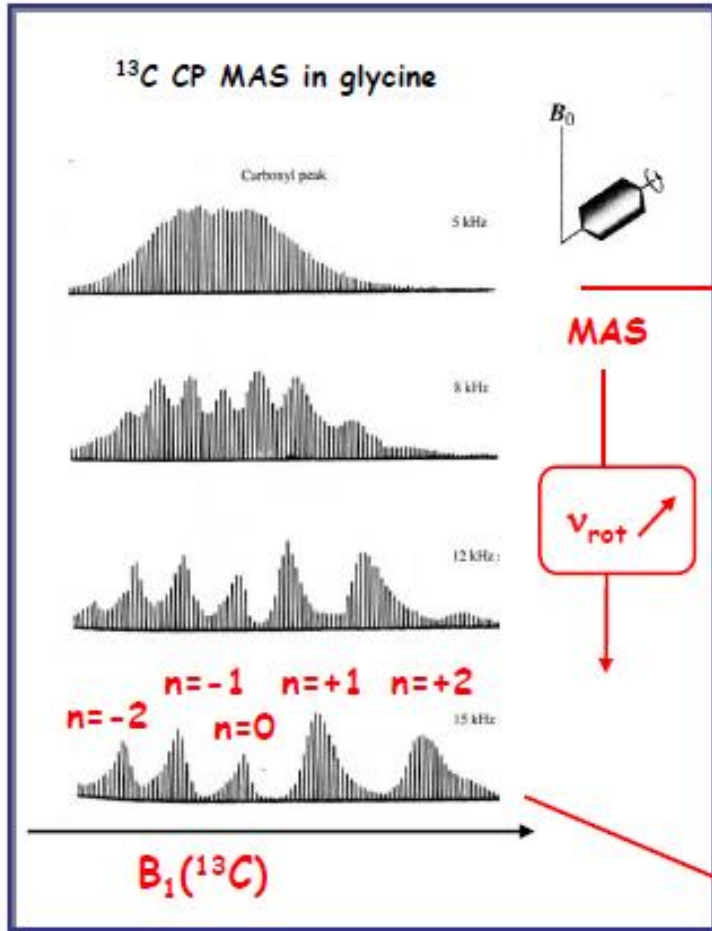

${}^{13}\text{C}_{\text{quat}}$  are underestimated at short contact time

$\lambda = T_{CH}/T_{1\rho}({}^1\text{H})$  influence  $M_{\text{exp}}$

Care must be taken with materials involving several  $T_{1\rho}({}^1\text{H})$  !

# CP and MAS

solutions...

variable amplitude during the contact

Burum, Encyclopedia of NMR, 1996, 1539.

# Distance measurement by CP MAS experiments

why distances ?...

remember:  $D_{IS} \sim \gamma_I \gamma_S / r_{IS}^3$

↓  
CP transfer !

for a spin pair I-S at

$$\Omega_{II} = \Omega_{IS} \pm n \Omega_{rot}$$

the frequency of the oscillations gives  $D_{IS}$  !

Azaïs et al., Inorg. Chem., 2002, 41, 981.

# 2D experiments: isotropic / anisotropic data

general idea: 2D correlations between isotropic  $\delta$  and anisotropies

the interaction must be reintroduced

ex:  $\delta_{iso}$  vs  $\Delta_{CSA}$  - Magic Angle Turning

**A simple formalism for the analysis of NMR in the presence of exchange**

By M. GOLDMAN

CEA/DSM/DRECAM/Service de Physique de l'Etat Condensé, CE Saclay,  
F-91191 Gif-sur-Yvette Cedex, France

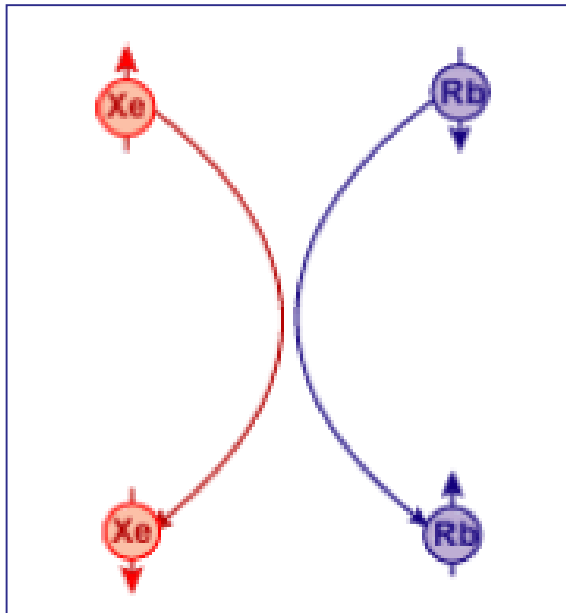

(Received 15 May 1995; accepted 7 June 1995)

A theoretical model is presented for the analysis of NMR in the liquid state, when the NMR parameters are modulated by chemical exchange. This model, based on the sudden jump approximation, describes directly the free induction decay signals, without analysing first their derivative. This formalism, which is extremely simple, applies in particular to the modulation of indirect interactions by intermolecular exchange, a case whose usual description is rather complicated.

**Goldman (1995)**

- ♦ DYNAMICS ?

# Dynamic Nuclear Polarization (DNP)

## State-of-the-art

Dynamic nuclear polarization is based on the idea of transferring the at least 600 times higher electron spin polarization onto nuclear spins. This concept originally proposed by Overhauser in 1953 [Overhauser] was at first experimentally proven in metals by Slichter [Slichter] and later on also observed in liquids [Hauser, Müller-Warmuth]. Analyzing DNP experiments performed at low temperatures on solids with localized electron spins in order to obtain highly polarized targets revealed that in such solid-state systems other polarization transfer mechanisms are effective: the so-called solid-state effect [Abragam], cross-effect [Hill] and thermal mixing [Goldman]. They refer to the dipolar coupling of the nuclear spin to one, two or more electron spins, respectively. All the investigated mechanisms predicted reduced transfer efficiencies at higher magnetic field values. This in combination with the lacking microwave technology to effectively excite e' field values above 1 T turned DNP into an 'endangered species' while N towards higher spectral resolution and higher magnetic fields [Wind, Yannon 20 years until breakthroughs of DNP at high magnetic fields were achieved SS-MAS-DNP for structural biology applications [Griffin] and later on the A the possibility to employ such polarized samples at very low temperatures for

# Dynamic Nuclear Polarization (DNP)

## State-of-the-art

Dynamic nuclear polarization is based on the idea of transferring the at least 600 times higher electron spin polarization onto nuclear spins. This concept originally proposed by Overhauser in 1953 [Overhauser] was at first experimentally proven in metals by Slichter [Slichter] and later on also observed in liquids [Hauser, Müller-Warmuth]. Analyzing DNP experiments performed at low temperatures on solids with localized electron spins in order to obtain highly polarized targets revealed that in such solid-state systems other polarization transfer mechanisms are effective: the so-called solid-state effect [Abragam], cross-effect [Hill] and thermal mixing [Goldman]. They refer to the dipolar coupling of the nuclear spin to one, two or more electron spins, respectively. All the investigated mechanisms predicted reduced transfer efficiencies at higher magnetic field values. This in combination with the lacking microwave technology to effectively excite electron spins at magnetic field values above 1 T turned DNP into an 'endangered species' while NMR was briskly moving towards higher spectral resolution and higher magnetic fields [Wind, Yannoni, Schäfer]. It took almost 20 years until breakthroughs of DNP at high magnetic fields were achieved: Griffin et al. pioneered SS-MAS-DNP for structural biology applications [Griffin] and later on the Amersham group explored the possibility to employ such polarized samples at very low temperatures for liquid state spectroscopy
